

Pat's Potion for Poisoning that causes Frothy Bloat/Vomiting (this only works for frothy bloat and vomiting)

Pepto Bismol – 30 cc for 150 to 200 lb goat
20 cc for 100 to 150 lb goat

Penicillin ORALLY- 5cc to 10 cc

Mineral Oil – 10cc to 15 cc

CD ANTI-TOXIN 10cc – 15 cc ORALLY

Mix the above ingredients together and use a drenching syringe to dose animal. Give it slowly as they may choke and gag from the vomiting. You will see relief almost instantly.

Inject CD ANTI-TOXIN subQ according to label recommendations.
Banamine (use weight appropriate dose)

Pepto Bismol coats the gut and esophagus.

Penicillin slows the growth of the bad bacteria that is opportunistic under these circumstances.

Mineral Oil also coats and helps move the toxins out. It also breaks up the froth/bloat.

CD ANTI-TOXIN provides protection from Type C/D Clostridium Perfringens
Banamine soothes gut pain

Can be repeated in 12 hours if needed. I omit the penicillin if dose is repeated but use all the other ingredients. One dose usually stops the frothing and vomiting.

Withhold feed and hay until goat is recovered. They can have water available but do not offer hay until 24 hours after the vomiting stops. Once they are eating hay for a 24 hr period with no problems you can slowly add feed back into their diet.

Dose with Register Supplies 1-888-310-9606 probiotic paste "**SYNGUARD**" which has a guaranteed analysis of 1,000,000,000 (one billion) colony forming units per gram of Bifidobacterium Thermophilum, Lactobacillus Acidophilus to repopulate the gut with healthy bacteria after the vomiting/frothy has been stopped for 24 hours.
